

PRIVATE OVERVIEW · PREPARED FOR ARIHANT JAIN

The operating layer for real businesses.

Capabilities, Retail OS and the commercial framework — how DevShop thinks about a business, builds for it, and gets paid from the value it creates.

DevShop is an AI, software and automation **operating partner** for real businesses. It doesn't just ship software — it studies how a business actually runs, then rebuilds the parts that matter with the right mix of people, software, automation and AI.

Built fast, for real businesses.

01 · THE THESIS

Not another AI agency. An operating partner.

Software is easy to add. Improving how a business actually operates is the hard part — and the only part worth paying for.

I start with the business, not the tool. Every problem is broken down the same way, so the answer is specific rather than generic:

Then each task is decided on its own merits — **human, software, automation, AI, or human + AI** — never automated by default. That decomposition runs on **PTM™ — Process, Training, Mapping**: what work happens, what your team needs to know, and who does each part.

THE LINE THAT DOESN'T MOVE

Machines do the work. Money, people and promises stay with a human.

Every task is classified **Manual, Semi-Automated, Automated or Fully AI-driven**, and every AI action is scoped to *Execute, Recommend or Assist* against a human who decides or reviews.

02 · WHAT DEVSHOP DOES

Four ways the work shows up

LIVE

A · Custom builds

Bespoke software, automation and AI for one specific business problem — priced per build. Internal operating tools, workflow automation, dashboards, customer journeys, integrations, reporting systems, and AI agents with controlled authority.

LIVE

B · Retail OS

The operating system for D2C / consumer brands: an operating layer, not one isolated build. Lead → audit → plan → onboard → operate → report → improve. *Detailed on the next page.*

LIVE

C · AI inside the workflow

AI applied where it earns its place — classification, drafting, research, reconciliation, reporting, next-best-action, orchestration. Drawn from a curated library of defined agent roles, admin-approved rather than model-invented, so it can't hallucinate a capability it doesn't have.

DIRECTION

D · Operating systems

Retail OS is the first vertical operating system, and live today. Others — hospitality, restaurants, property — are the direction of travel, **not products yet**. Only what exists is offered.

One operating layer for a consumer brand.

Data, operations, growth, reporting and financial visibility in one system — run for the founder, with the numbers visible.

THE LIFECYCLE — GO-LIVE IN 7 DAYS

The 7-day clock starts the moment a brand's data is connected — not at first contact. Onboarding is not "connect Shopify and run ads": the point is to understand the economics first.

WHAT A BRAND SHARES

Commercial	Catalogue, pricing, channels, formats (D2C / marketplace / subscription), commercial terms.
Financial	Sales, COGS, shipping, fulfilment, marketing spend, payment costs, other attributable costs.
Operations	Fulfilment & carrier, payment mode, return window, target cities, business registration.
Marketing	Channels, ad budget, campaigns, performance data.
Technology	Shopify, Meta, GA4, Search Console, Amazon / Flipkart — read-only, or CSV upload.

Access is granted after the NDA is signed. Only aggregate metrics are stored; customer PII is blocked by design and credentials are encrypted.

THE ECONOMIC ENGINE — NOT JUST REVENUE

Revenue	what & at what price
– COGS	cost to make / source
– Marketing / acquisition	CAC, ad spend
– Fulfilment	shipping, RTO, packaging
– Payments	gateway & COD handling
– Ops & technology	people, platform, admin
Profit pool	what growth actually leaves behind

Exact structure depends on the brand. The question is always where contribution is made or lost — revenue growth isn't a win if the profit pool shrinks with it.

METRICS WATCHED IN CONTEXT

THE OPERATING RHYTHM

Once live, I run it: operating tasks, ongoing growth and support, and an honest reconciled statement each week. Every Monday a brand sees its numbers and is settled its money — reporting daily / weekly / monthly as agreed.

04 · HOW WE ENGAGE

Scope before price. Complexity sets the resource.

No one-size-fits-all monthly technology fee. Commercials reflect real effort, and are agreed before any work begins.

ENGAGEMENT	FOR	COMMERCIALS
1 · Custom Build	A specific problem needing bespoke technology / AI / automation.	Build priced per scope — agreed first; payment secures the slot and starts the build clock. Then a monthly fee to keep it running and improving. Genuinely complex systems are human-priced after a short scoping call.
2 · Retail OS	Consumer brands that want an operating layer, run for them.	₹5,000 deposit — fully adjusted against actual onboarding tech cost; DevShop keeps none; no other upfront fee. Then one model: profit share ~40% of the profit pool (standard, can come down), revenue share 15–20% , or a retainer from ₹2.5L / month .
3 · Combination	A brand needing bespoke functionality alongside the operating system.	Scoped to the actual requirement — Custom Build commercials for the build, Retail OS commercials for the operating layer.

Pre-revenue founders can enter Retail OS on an AI-enabler track: DevShop's return is a share of the brand IP rather than a profit-pool split. Anything outside an agreed scope is discussed and priced separately, not absorbed silently.

COMMERCIAL PRINCIPLES

- Scope before price.
- Complexity sets resources — hours behind the price, named.
- Human vs. AI decided per task, in the open.
- Direct technology costs are transparent; ad spend at cost.
- Support reflects real operating need.
- Agreed before work starts; material changes re-scoped.
- Delivery economics are measured, so future pricing is evidence-based.

WHAT A CLIENT PROVIDES

- Timely, accurate access & data.
- A decision-maker and approvals.
- Relevant credentials, by named invitation.
- Feedback and priorities on agreed timelines.
- Payment on agreed terms.

WHAT A CLIENT RECEIVES

- Clear scope and responsibilities.
- Transparent commercials.
- A defined build, QA and go-live.
- Client review and acceptance.
- Ongoing reporting and support.

THE BIGGER IDEA

A layer between how a business runs today and how it could run with better software, AI, data

LET'S TALK

Happy to go deeper on any part of this.
